

K.Quotes — Keter Marketing Quote & Invoice Generator

Developer Brief (v1)

Product name: K.Quotes

1. Purpose

Replace the current Claude AI Project workflow (which is rate-limited) with a standalone web app — named **K.Quotes** — that generates pixel-perfect, branded PDF quotes ("Devis") and invoices ("Factures") for Keter Marketing's CV/LinkedIn optimization services — instantly, for free, without any AI API call in the critical path.

No AI model is required to run this app. It is a deterministic form → template → PDF engine.

2. Assets provided (attach to repo)

- `keter-logo.png` — official logo, transparent background, gold "K" + "Keter Marketing" wordmark. Must be re-exported as a **transparent PNG or SVG** (the uploaded file is a PDF — extract/re-render the logo at high resolution, at least 1000px wide, transparent background, no black backdrop).
- `devis-reference-template.pdf` — the official reference layout (2 pages) that the generator must match visually 100%.

Store both in `/assets/` in the repo. Do **not** rely on parsing the PDF at runtime — instead, use them as the visual spec to hand-build the template in code (HTML/CSS or a PDF layout library), as described in §5.

3. Core user flow

Single-page form (not a chat, not step-by-step wizard — this is a web form, so all fields can be visible at once, grouped in sections) with:

Section A — Document type & language

- Toggle: `Devis` / `Facture`
- Toggle: `Français` / `English`

Section B — Client info

- Client number (integer, required) → auto-computes quote number
- Date (date picker, default = today)
- Full name
- City
- Country
- Phone
- Email

Section C — Service

- Radio: ☐ CV Optimization / ☐ LinkedIn Optimization / ☐ CV + LinkedIn
- Price field(s): show ONE price input if single service, TWO price inputs (labelled by service) if combo
- Quantity is never manually entered — it's derived: 1 for single service, 2 for combo (2 line items, not "qty 2" of one line — see §4)

Section D — Payment / bank details

- Pre-filled with the default bank details below, all fields editable inline:
 - Account Holder:
 - IBAN:
 - BIC:
 - Bank:
- A separate optional field: **Payment link (URL)** — pre-filled with the default below, editable per quote. If filled, it appears in the payment section alongside/instead of bank details (see §4 rendering rule).
 - Default payment link:
- "Reset to default" button next to this section to restore the saved defaults if the user edited them.

Section E — Invoice-only fields (shown only when document type = Facture)

- Payment status (default: /)
- Payment date (default: today)

Action buttons

- → renders and downloads the PDF
 - → saves the quote to local storage/DB so an invoice can be created afterward without re-entering data (see §6)
-

4. Business rules (must be enforced exactly)

Quote numbering

- Format: + client number, zero-padded to 5 digits → , ,
- Invoice number = same digits, prefix instead of → becomes

Quantity / line items

- CV only → 1 line item, qty 1
- LinkedIn only → 1 line item, qty 1

- CV + LinkedIn → **2 separate line items** (one per service), each qty 1, each with its own price and description — not one line with qty 2. Total = sum of both.

Service descriptions (auto-inserted, adapt by language)

CV Optimization line item bullets:

- Audit stratégique du profil et du positionnement
- Refonte exécutive du CV optimisé ATS
- Restructuration et mise en valeur des compétences
- Repositionnement du discours professionnel
- Amélioration de la lisibilité et de l'impact candidat
- Présentation stratégique adaptée au marché ciblé

LinkedIn Optimization line item bullets:

- Optimisation du positionnement LinkedIn
- Amélioration de la visibilité et de l'attractivité recruteur
- Restructuration complète du profil
- Branding professionnel stratégique
- Renforcement de la présence en ligne

(English equivalents needed for both sets — straightforward translations, same bullet count.)

Thank-you note (top of doc, above the table), by service:

- CV only: *"Merci pour votre confiance. Le présent devis concerne un accompagnement stratégique en optimisation de CV et repositionnement professionnel exécutif."*
- LinkedIn only: *"Merci pour votre confiance. Le présent devis concerne un accompagnement stratégique en optimisation de votre visibilité et positionnement LinkedIn."*
- Both: *"Merci pour votre confiance. Le présent devis concerne un accompagnement stratégique en optimisation de CV, positionnement professionnel et visibilité LinkedIn."*
- Use "devis"/"quote" or "facture"/"invoice" depending on doc type.

Never include: "TVA non applicable, art. 293 B du CGI" — this line must never appear anywhere in the document.

Payment section rendering rule (page 2, "Coordonnées bancaires")

- If a payment link is provided for this quote → show both the bank details block AND the payment link (as a clickable line, e.g. "Paiement en ligne : [lien]").
- If no payment link is provided → show bank details only.

Default conditions (always included, static text, page 1 "Conditions" area is payment terms; general conditions go on page 2):

- Mission réalisée à distance.
- Livraison des livrables au format numérique.
- Démarrage du travail après réception du règlement.
- Une série d'ajustements mineurs est incluse après livraison.
- Les informations transmises par le client restent strictement confidentielles.

Invoice-specific additions (only when doc type = Facture):

- Title changes "Devis" → "Facture" everywhere (header, footer line, filename)
 - Add a payment block: `Statut : Payé` / `Mode de règlement : Virement bancaire` / `Date de règlement : [date]`
-

5. Visual & design requirements

This covers two *separate* things: (5.1) the PDF document design, which is locked to your existing template, and (5.2) the web app's own interface design — the form/dashboard your developer will build, which had no design direction yet.

5.1 PDF template (must match reference PDF exactly)

This is the part that needs the most care. Build the document as an **HTML+CSS template rendered to PDF** (e.g. Puppeteer/Playwright printing to PDF, or `react-pdf` / `pdf-lib` with a hand-coded layout) — not a generic PDF library with default styling. The HTML+CSS route is strongly recommended because it's far easier to match spacing/typography exactly and to maintain later.

Exact layout spec, from the reference PDF:

Page 1

- Top-left: big bold title `Devis D2600004` (or `Facture F2600004`), date directly underneath in gray, smaller.
- Top-right: Keter Marketing logo, vertically centered with the title/date block, never crossing the horizontal rule below.
- Horizontal separator rule under the header.
- Two-column block: `Émetteur` (left) / `Destinataire` (right), label:value rows, label in gray, value in bold black. Émetteur is always the static Keter Marketing info; Destinataire is the client's data (name, city, country, phone, email).
- Horizontal rule.
- Bold "Merci pour votre confiance." line, then a paragraph below it — the thank-you note from §4.
- "Détail" heading (bold).
- Table:
 - Columns: `Type | Description | Prix unitaire | Qté | Total`
 - Header row background: pure `#000000`, text white/high-contrast

- Body row(s): `Type` = "Service"; `Description` = bold service name + bullet list (■ prefix) + italic delivery note line ("Délai estimé : 48h à 72h | Livraison numérique")
- `TOTAL` row: last row **inside the table**, black background (■ #000000), "TOTAL" uppercase left-aligned, amount right-aligned, no vertical divider between them
- Two-column block: `Conditions` (left: Conditions de règlement / Mode de règlement / Validité du devis 5 jours / Notes) and `Bon pour accord` (right: signature line, "Signature et cachet", "Qualité de signataire")
- Footer: left = `Devis D2600004` / `Document confidentiel - Stevens AKPOVI`; right = `Page 1 sur 2`

Page 2

- `Coordonnées bancaires` heading, label:value rows (Titulaire du compte, IBAN, BIC, Banque, Mode de paiement, Conditions) — plus the payment link line if applicable (§4)
- Clear vertical whitespace (not compressed) before the next section
- `Conditions générales de vente` heading, bullet list (■ prefix) — the 5 static conditions
- Large, centered, low-opacity watermark of the Keter Marketing logo/wordmark behind the content, must not reduce text legibility
- Footer: same left block; right = `Page 2 sur 2`

Global

- Identical left/right margins on both pages
- Same fonts, sizing and gray/black color values throughout — pick one clean sans-serif (e.g. Inter, Helvetica Neue) matching the reference proportions
- Currency formatting: `120,00 €` style (French number formatting) when language = FR; adapt to `€120.00` / appropriate format when language = EN — keep it simple and consistent

5.2 Web app interface design (the tool itself — not the PDF)

This is the design of the actual screen you'll use to fill the form and manage quotes. It should feel like an extension of the Keter Marketing brand (gold "K", black, premium/executive) — not a generic gray SaaS admin panel. Below is a concrete design system your developer should build to, not just a vibe.

Color palette

Token	Hex	Use
Ink black	 #0B0B0C	Primary text, headers, nav, table headers (echoes the PDF's bands)  #000000
Paper white	 #FAFAF8	Page background
Warm gold	 #C9A227	Primary accent — buttons, active states, focus rings, quote-number stamp (pulled directly from the logo's gold gradient)
Pale gold	 #F1E4B8	Subtle highlight fills (selected radio card, hover backgrounds) — used sparingly
Slate gray	 #6B6B6F	Secondary text, field labels, borders
Signal green	 #3B7A57	Success states only ("Quote saved", "Paid") — muted, not a bright SaaS green

Gold is the accent, used deliberately and sparingly (buttons, the quote-number display, section markers) — the interface should read as mostly black-on-white/ink-on-paper, so the gold moments actually stand out, the same way your logo uses gold against white.

Typography

- Display/headers: a refined serif with executive weight — e.g. **Fraunces** or **Canela** (or closest license-free equivalent) for page titles and section headers. This is what gives the tool a "consulting firm" feel rather than a generic dashboard feel.
- Body/UI/labels: a clean grotesk sans — e.g. **Inter** or **General Sans** — for form labels, inputs, buttons, table data.
- Quote/invoice numbers (): rendered in a **monospace** face (e.g. JetBrains Mono or IBM Plex Mono), in gold, slightly letter-spaced — this is the app's signature visual moment: it should look like a stamped serial number/ledger entry, not just plain text in a form field. Show it live, updating as soon as the client number is typed.

Layout

- Two-column working screen on desktop: left ~55–60% is the step-through form (Sections A–E from §3, grouped in clearly separated cards with generous whitespace); right ~40–45% is a **live preview panel** — a scaled-down visual of the actual PDF page 1, updating in real time as fields are filled, so you can see the document taking shape rather than trusting a blank form. On mobile, stack the preview below the form as a collapsible section.
- Flat, no heavy drop-shadows or bevels — thin 1px hairline borders ( #E5E2D8)-ish) between cards, generous padding, no rounded-pill buttons — rectangular or very slightly rounded (2–4px) corners to match the document's own crisp, un-rounded aesthetic.

- "My Quotes" list view: a clean table (echoing the black-header table style from the PDF itself) — columns: Quote #, Client, Date, Amount, Status, Actions (Download / Generate Invoice).

Signature element The live-updating gold monospace quote-number "stamp" tied to the preview panel — as the user fills the form, they watch their own document assemble itself in real time next to it, with the serial number appearing like a wax seal. This is the one deliberate, memorable design moment; everything else stays quiet and disciplined around it. It also doubles as a natural home for the product name/wordmark — **K.Quotes** — displayed in the same gold monospace treatment in the app header, next to the Keter Marketing logo.

Interaction/quality bar

- Fully responsive down to mobile (you said you use this between client conversations on the go).
 - Visible keyboard focus states (gold outline).
 - No unnecessary animation — a single smooth transition when the live preview updates is enough; avoid decorative motion.
 - Empty states (e.g. "My Quotes" with nothing saved yet) should read as an invitation ("No quotes yet — create your first one above") not a blank void.
-

6. Data persistence (for the invoice feature)

The app needs light persistence so "generate the invoice for this quote later" doesn't require re-typing everything. Since Supabase is already in the stack, use it from day one instead of a localStorage-only v1:

- Save each generated quote (all form field values: client info, service, prices, bank/payment link used, language, quote number) to a Supabase table, keyed by quote number.
 - A "My Quotes" list view (fed by Supabase) shows past quotes with a "Generate Invoice" button next to each — pre-fills the invoice form from the saved quote data, applies the D→F number swap, and asks only for payment date/status.
 - This also gives cross-device access automatically, since data lives in Supabase rather than the browser.
-

7. Language toggle (FR/EN)

- One global toggle switches all static labels, section headers, and the service description bullets/thank-you note to their English equivalents.
 - Only the document's language changes — pricing format and layout stay structurally identical.
 - All static FR strings above need an EN counterpart prepared before development starts (straightforward direct translations, same tone: professional/executive).
-

8. Non-functional requirements

- **No AI/Claude API involved** — this is a deterministic template engine, so there's no rate limit issue.
 - **Confirmed stack:**
 - Frontend: **Vercel** (Next.js or plain React app)
 - Backend (PDF generation / API routes): **Railway** — this also solves the Puppeteer/headless-Chrome hosting restriction some free frontends have, since Railway can run a full Node server with Chrome installed
 - Database (for saved quotes → invoice flow, see §6): **Supabase**
 - **PDF generation engine (confirmed): server-side Puppeteer on Railway.** Build the template as HTML/CSS (per §5.1), render it with the quote's data, and print to PDF via headless Chrome on the Railway backend. This is chosen over browser-side print (no reliable pixel control, no clean download flow) and over `react-pdf` (its primitive component model makes exact layout matching — the black TOTAL row, the page-2 watermark, precise typography — much harder than plain HTML/CSS). Flow: Vercel frontend sends form data → Railway API renders the HTML template → Puppeteer prints to PDF → file returned for download, quote optionally saved to Supabase in the same request.
 - **Mobile-friendly form** (used from phone between client conversations).
 - **Filename:** `Devis_D2600004_Eric_De_Lavarene.pdf` style —
`{Type}_{QuoteNumber}_{ClientFirstName}_{ClientLastName}.pdf`.
-

9. Suggested build order

1. Build the HTML/CSS template for page 1 + page 2, hardcoded with the sample data from the reference PDF, until it's visually identical when printed to PDF.
 2. Wire up the form → template with dynamic data binding (client info, service, pricing, totals).
 3. Add the FR/EN toggle.
 4. Add bank details / payment link default + override with a "reset to default" action.
 5. Add quote save (localStorage) + "My Quotes" list.
 6. Add invoice generation flow (D→F swap, payment block, reuse saved quote data).
 7. QA: generate several quotes/invoices (CV only, LinkedIn only, both, FR, EN) and compare pixel-by-pixel against the reference PDF.
-

10. Notes for the developer

- English translations of the French service bullet lists and thank-you notes are the developer's responsibility — translate directly and consistently with the professional/executive tone of the French originals (§4). No client sign-off needed on wording.

- Stack, default payment link, and persistence approach are confirmed (§6, §8) — no open decisions remaining before dev starts.
